Table of Contents

Preface	1
Chapter 1: Building Your First Electron Application	7
Technical requirements	7
What is Electron?	8
Preparing a development environment	9
Installing Visual Studio Code	9
Installing Visual Studio Code for Ubuntu	10
Setting up the environment for macOS	10
Installing Git on macOS	10
Installing Node.js on macOS	11
Setting up the environment for Ubuntu Linux	12
Installing Git on Ubuntu	12
Installing Node.js on Ubuntu	12
Setting up the environment for Windows	13
Installing Git on Windows	13
Installing Node.js on Windows	15
Verifying the installation	16
Creating a simple application	16
Packaging for multiple platforms	21
Packaging for macOS	22
Packaging for Ubuntu	25
Packaging for Windows	27
Summary	30
Chapter 2: Building a Markdown Editor	31
Technical requirements	31
Configuring a new project	32
Integrating the editor component	35
Fitting the screen size	38
Integrating the application menu	39
Creating a custom menu item	41
Defining menu item roles	44
Providing menu separators	46
Supporting keyboard accelerators	47
Supporting platform-specific menus	49
Configuring the application name in the menu	50
Hiding menu items	52
Sending messages between processes	54
Introducing editor-event	55
Sending confirmation messages to the main process	55

Sending messages to the renderer process	57
Wiring the toggle bold menu	59
Saving files to a local system	60
Using the save dialog	64
Loading files from a local system	69
Creating a file menu	73
Adding drag and drop support	75
Supporting automatic updates	78
Testing automatic updates	86
Changing the title of the application	89
Summary	90
Chapter 3: Integrating with Angular, React, and Vue	91
Technical requirements	92
Building an Electron application with Angular	92
Generating our Angular project scaffold	93
Integrating the Angular project with Electron	96
Configuring Live Reloading	100
Why test in the browser?	103
Setting up production builds	103
Setting up conditional loading	105
Using Angular Material components	107
Modifications made by installing Angular Material	108
Adding the Material Toolbar component	109
Angular routing	111
Building an Electron application with React	118
Generating a React project	119
Live reloading	123
Setting up production builds	126
Setting up conditional loading	128
Using the Blueprint UI toolkit	129
Adding an application menu	130
Adding routing	132
Final touches	134
Building an Electron application with Vue.js	136
Creating a Vue configuration file	140
Live reloading	142
Production builds	144
Setting up conditional loading	145
Adding routing	147
Configuring Vue Material	149
Creating an application toolbar	150
Summary	153
Chapter 4: Building a Screenshot Snipping Tool	155
Technical requirements	156

Preparing the project	156
Configuring frameless windows	157
Additional options for macOS	160
Using the hidden titleBarStyle	160
Using the hiddenInset titleBarStyle	161
Using the customButtonsOnHover titleBarStyle	161
Transparent windows	162
Making application windows draggable	167
Adding a snip toolbar button	168
Using the desktopCapturer API	169
Calculating the primary display size	171
Generating and saving a thumbnail image	172
Resizing and cropping the image	174
Testing the application's behavior	177
Integrating with the system tray	178
Hiding the main application window on startup	180
Registering global keyboard shortcuts	181
Summary	183
Chapter 5: Making a 2D Game	185
Technical requirements	186
Configuring a game project	186
Running a Hello World example	190
Rendering background images	193
Preventing window resizing	195
Rendering a sprite	195
Scaling sprites	196
Handling keyboard input	198
Flipping sprites based on their direction	200
Controlling sprite coordinates	201
Controlling sprite speed	204
Summary	206
Chapter 6: Building a Music Player	207
Technical requirements	207
Creating a project scaffold	208
Exploring the music player component	210
Downloading music files	212
Providing basic player setup	215
Using AmplitudeJS elements	216
Implementing the global play button	217
Implementing the global pause button	218
Implementing the global play/pause button	219
Styling buttons	219
Exploring the playback control buttons	222

Stop button	223
Mute and unmute buttons	225
Volume buttons	227
Implementing a song progress bar	230
Displaying music metadata	232
Improving the user interface	237
Reviewing the final structure	240
Summary	243
Chapter 7: Analytics, Bug Tracking, and Licensing	245
Technical requirements	246
Understanding analytics and tracking	246
Creating your own solution or using an existing service	247
Creating your own analytics services	248
Using third-party analytics services	248
Using Nucleus for Electron applications	249
Creating a new Nucleus account	250
Creating a new project with tracking support	254
Installing the Nucleus Electron library	256
Inspecting real-time analytics data	258
Identifying users	263
Disabling tracking per user request	263
Verifying real-time user statistics	264
Supporting offline mode	265
Handling application updates	266
Loading global server settings	268
License checking and policies	270
Creating a new policy and license	271
Checking licenses in the application	275
Summary	276
Chapter 8: Building a Group Chat Application with Firebase	277
Technical requirements	278
Creating an Angular project	279
Configuring the Electron Shell	281
Creating a Firebase account	284
Creating a Firebase application	288
Configuring Angular Material components	291
Adding a Browser Animations module	291
Configuring the default theme	292
Adding the Material Icons library	292
Adding a navigation bar	292
Testing the application with the material toolbar	294
Building a login dialog	294

Implementing the Material interface	296
Supporting error handling	298
Preparing the chat component placeholder	299
Connecting the login dialog to Firebase Authentication	301
Enabling the sign-in provider	301
Creating demo accounts	304
Integrating the Login dialog with Firebase	306
Configuring the Realtime Database	310
Creating demo groups	312
Rendering the group list	314
Testing real-time updates	316
Implementing the group messages page	318
Displaying group messages	320
Improving query performance	324
Sending group messages	325
Updating the message list interface	328
Ideas for further enhancements	329
Verifying the Electron Shell	329
Summary	330
Chapter 9: Building an eBook Editor and Generator	331
Technical requirements	332
Creating the project structure	332
Generating a new React application	332
Installing the editor component	334
Testing the web application	339
Integrating with the Electron shell	341
Updating the code to use React Hooks	343
Controlling keyboard shortcuts	344
Loading files	346
Saving files	349
Integrating with the application menu	352
Setting up the book generator	355
Installing Docker	356
Running the Pandoc container	360
Sending documents to the main (Node.js) process	363
Invoking Docker commands from Electron	366
Sending the markdown text to the Node.js process	366
Saving the markdown text to the local drive	367
Generating PDF books	370
Generating ePub books	373
Summary	376
Chapter 10: Building a Digital Wallet for Desktops	377
Technical requirements	378

Generating the project scaffold with React	378
Integrating the Ant Design library	380
Setting up a personal Ethereum blockchain	383
Configuring the Ethereum JavaScript API	388
Displaying Ethereum Node information	390
Getting node information	390
Rendering node information in the header	391
Integrating with the application menu	393
Rendering a list of accounts	394
Showing our account balance	399
Transferring Ether to another account	401
Packaging the application for distribution	408
Summary	411
Other Books You May Enjoy	413
Index	417
